

Transmission Business Line (TBL)

Broadview-Garrison (Montana Intertie)

Updated: September 30, 2004

The Transmission Business Line (TBL) posts Available Transmission Capacity (ATC) for TBL's portion of the Broadview to Garrison transmission path (also known as the Montana Intertie) on its OASIS. Outages and other operational constraints involving the Broadview-Garrison flowgate are reflected in the Operational Transfer Capability (OTC) values for the Montana to PNW flowgate.

For information about the OTC implications of Broadview-Garrison outages, refer the Curtailments & Interruptions page on the TBL web site in the MPC-NW section of the Known Constraints and Outages section, and to the West of Garrison section of the Northwest Power Pool 45 day outage process spreadsheets.

The Broadview to Garrison path is comprised of two lines:

Broadview - Garrison #1 500kV

Broadview - Garrison #2 500kV

This path is limited in the east to west direction. TBL does not have west to east transmission rights in the Broadview-Garrison 500kV lines. Consequently ATC is computed and tracked only in the east to west direction for this path.

To request service over this path specify Broadview 500kV as the POR and Garrison 500kV as the POD.

Point to Point service over TBL's share of the Broadview-Garrison 500kV lines is provided at the Montana Intertie Rate. Refer to the current Transmission and Ancillary Service Rate Schedules for rate information,

http://www2.transmission.bpa.gov/Business/Rates_and_Tariff/default.cfm?page=current.

Service over this path only goes to the Garrison 500kV bus. Since load or non-TBL transmission is not available at the Garrison 500kV bus, customers who take service over TBL's share of the Broadview-Garrison 500kV lines must also obtain either firm or nonfirm Point to Point transmission service on TBL's Network System.

If you have questions, please contact your TBL Account Executive or the TBL Reservation Desk at (360) 418-8499
